Paper 3 Practical Test

May/June 2023

1 hour 30 minutes

You must answer on the question paper.

You will need: The materials and apparatus listed in the confidential instructions.

INSTRUCTIONS

- Answer all questions.
- Use a black or dark blue pen. You may use an HB pencil for any diagrams or graphs.
- Write your name, centre number and candidate number in the boxes at the top of the page.
- Write your answer to each question in the space provided.
- Do **not** use an erasable pen or correction fluid.
- Do not write on any bar codes.
- You may use a calculator.
- You should show all your working and use appropriate units.

INFORMATION

- The total mark for this paper is 40.
- The number of marks for each question or part question is shown in brackets [].
- Notes for use in qualitative analysis are provided in the question paper.

This document has 12 pages. Any blank pages are indicated.

1 Aqueous ammonia is a solution of ammonia gas.

You are provided with two samples of aqueous ammonia labelled **A** and **B**.

You are going to investigate the reaction between these samples and 0.500 mol/dm³ hydrochloric acid.

Read all the instructions carefully before starting the experiments.

Instructions

You are going to do **four** titration experiments.

Rinse and fill a burette with 0.500 mol/dm³ hydrochloric acid.

(a) Experiment 1

- Use a volumetric pipette to add 25.0 cm³ of A to a conical flask.
- Add five drops of methyl orange indicator to the conical flask.
- Record the initial burette reading in Table 1.1.
- Add 0.500 mol/dm³ hydrochloric acid from the burette while swirling the flask, adding drop by drop near the end-point, until the solution just changes colour.
- Record the final burette reading in Table 1.1.

Experiment 2

- Empty the conical flask and rinse it with distilled water.
- Refill the burette if necessary.
- Repeat experiment 1.

Complete Table 1.1 with the volume used in each experiment.

Table 1.1

	Experiment 1	Experiment 2
final burette reading/cm ³		
initial burette reading/cm ³		
volume used/cm ³		

[4]

(b) Experiments 3 and 4

- Empty the conical flask and rinse it with distilled water.
- Refill the burette if necessary.
- Repeat Experiments 1 and 2 using B instead of A.
- Record the initial and final burette readings for experiments 3 and 4 in Table 1.2.
- Complete Table 1.2 with the volumes used in experiments 3 and 4.

Table 1.2

	Experiment 3	Experiment 4
final burette reading/cm ³		
initial burette reading/cm ³		
volume used/cm ³		

[2]

[1]

(c) State the colour change observed in the flask in each experiment.

(d) Suggest why you are provided with a white tile for use in these titrations.

.....[1]

(e) Calculate the mean volume of 0.500 mol/dm³ hydrochloric acid needed to neutralise 25.0 cm³ of **A** and of **B**.

(f) The equation for the reaction between hydrochloric acid and aqueous ammonia is shown.

$$HCl + NH_3 \rightarrow NH_4Cl$$

Use the mean volume of acid needed to neutralise 25.0 cm³ of **A** from **(e)** to calculate the concentration of ammonia in **A**.

Give your answer to an appropriate number of significant figures.

concentration mol/dm³ [2]

(g)	Calculate the volume of ammonia gas measured at room temperature and pressure, r.t.p. dissolved in $25.0\mathrm{cm^3}$ of A .
	The volume of one mole of any gas at r.t.p. is 24 dm ³ .
	volume dm ³ [2]
(h)	Use your answers to (e) and (g) to calculate the volume of ammonia gas measured at r.t.p dissolved in $25.0\mathrm{cm^3}$ of B .
	volume dm ³ [1]
(i)	The burette is rinsed with 0.500 mol/dm ³ hydrochloric acid immediately before it is filled.
	Explain why the burette should ${f not}$ be rinsed with distilled water immediately before it is filled with 0.500 mol/dm 3 hydrochloric acid.
	[2]
(j)	Suggest why universal indicator is not suitable for use in these titrations.
	[1]
	[Total: 17]

BLANK PAGE

2 You are provided with solution **W** and solid **X**.

Do the following tests, recording all of your observations at each stage.

Tests on solution W

(a)	Put 1 cm depth of W into a test-tube. Add aqueous sodium hydroxide drop by drop until a change is seen.
	Then add a further 2 cm depth of aqueous sodium hydroxide.
	Record your observations.
	[2]
(b)	Put 1cm depth of \mathbf{W} into a test-tube. Add 2cm depth of dilute nitric acid and then add 1cm depth of aqueous barium nitrate.
	Record your observations.
	[1]
(c)	Identify the cation and the anion in W .
	cation
(d)	Put 1 cm depth of W into a boiling tube. Add 1 cm depth of aqueous hydrogen peroxide.
	Record your observations.
	Test the gas given off.
	Describe the test and its result.
	Identify the gas.
	Keep the mixture for use in (e).
	observations
	test for gas and result
	identity of gas[4]

(e)	Add aqueous sodium hydroxide drop by drop to the mixture from (d) until a change is seen.
	Then add a further 2cm depth of aqueous sodium hydroxide.
	Record your observations.
	[2]
(f)	Identify the cation produced by the reaction in (d).
	[1]
Tes	t on solid X
(g)	Put a piece of X into a test-tube and add 2 cm depth of dilute sulfuric acid.
	Record your observations.
	Test the gas given off.
	Describe the test and its result.
	Identify the gas.
	observations
	test for gas and result
	identity of gas[4]
(h)	Suggest the identity of X .
	[1]
	[Total: 17]

3 You are not expected to do any experimental work for this question.

Baking soda is used to make bread rise. When baking soda is heated, it decomposes and carbon dioxide gas is released.

Baking soda also decomposes gradually when it is stored. The longer the baking soda is stored, the less carbon dioxide it releases when it is heated.

Plan an investigation to show which of two different samples of baking soda has been stored for longer.

Your plan should include the use of common laboratory apparatus and the two samples of baking soda. No other chemicals should be used.

Your plan should include:

- the apparatus needed
- the method to use
- the measurements to take
- the variables to control
- how to use the results to determine which sample has been stored for longer.

You may draw a diagram to help you answer the question.

BLANK PAGE

Notes for use in qualitative analysis

Tests for anions

anion	test	test result
carbonate, CO ₃ ²⁻	add dilute acid, then test for carbon dioxide gas	effervescence, carbon dioxide produced
chloride, C <i>l</i> ⁻ [in solution]	acidify with dilute nitric acid, then add aqueous silver nitrate	white ppt.
bromide, Br ⁻ [in solution]	acidify with dilute nitric acid, then add aqueous silver nitrate	cream ppt.
iodide, I ⁻ [in solution]	acidify with dilute nitric acid, then add aqueous silver nitrate	yellow ppt.
nitrate, NO ₃ ⁻ [in solution]	add aqueous sodium hydroxide, then aluminium foil; warm carefully	ammonia produced
sulfate, SO ₄ ²⁻ [in solution]	acidify with dilute nitric acid, then add aqueous barium nitrate	white ppt.
sulfite, SO_3^{2-}	add a small volume of acidified aqueous potassium manganate(VII)	the acidified aqueous potassium manganate(VII) changes colour from purple to colourless

Tests for aqueous cations

cation	effect of aqueous sodium hydroxide	effect of aqueous ammonia
aluminium, Al ³⁺	white ppt., soluble in excess, giving a colourless solution	white ppt., insoluble in excess
ammonium, NH ₄ ⁺	ammonia produced on warming	_
calcium, Ca ²⁺	white ppt., insoluble in excess	no ppt. or very slight white ppt.
chromium(III), Cr ³⁺	green ppt., soluble in excess	green ppt., insoluble in excess
copper(II), Cu ²⁺	light blue ppt., insoluble in excess	light blue ppt., soluble in excess, giving a dark blue solution
iron(II), Fe ²⁺	green ppt., insoluble in excess, ppt. turns brown near surface on standing	green ppt., insoluble in excess, ppt. turns brown near surface on standing
iron(III), Fe ³⁺	red-brown ppt., insoluble in excess	red-brown ppt., insoluble in excess
zinc, Zn ²⁺	white ppt., soluble in excess, giving a colourless solution	white ppt., soluble in excess, giving a colourless solution

Tests for gases

gas	test and test result
ammonia, NH ₃	turns damp red litmus paper blue
carbon dioxide, CO ₂	turns limewater milky
chlorine, Cl ₂	bleaches damp litmus paper
hydrogen, H ₂	'pops' with a lighted splint
oxygen, O ₂	relights a glowing splint
sulfur dioxide, SO ₂	turns acidified aqueous potassium manganate(VII) from purple to colourless

Flame tests for metal ions

metal ion	flame colour
lithium, Li ⁺	red
sodium, Na ⁺	yellow
potassium, K ⁺	lilac
copper(II), Cu ²⁺	blue-green
calcium, Ca ²⁺	orange-red
barium, Ba ²⁺	light green
